MADE IN THE U.S.A.

ENGINEERS & DESIGNERS

PRECISION RESISTOR'S MISSION STATEMENT

To continue a tradition ... with competitively priced, high quality, 100% USA produced custom precision fixed wire wound resistors, sensors and shunts for critical applications and to serve the needs of our customers who utilize these products.

PRC's product catalog contains all detailed information including complete electrical & mechanical description of our special-purpose resistance devices and demonstrates how these unique concepts for precision wire wounds will benefit you in today's hi-tech world as a design engineer

What Precision Means To You:

1. BETTER FLEXIBILITY FOR CUSTOM ENGINEERING
PRC's precision wire wounds are ideal for short run development projects as well as long production runs that are needed in a hurry. Set-ups and tooling are easier to assemble than other resistor types and specs can be quickly transferred from the model shop and laboratory to the production floor.

2. BUY ONLY WHAT YOU NEED
Why buy 50 pieces or more, if all you need are a few resistors for tests or a dozen parts to complete your requirement? Small quantity lots or high volume production quantities are accurately checked 100% to assure specified limits and delivered on time to meet critical schedules.

3. LARGE SELECTION
Widest range of values anywhere! You can specify any resistance value or decimal part of an ohm from 0.001Ω to 10MegΩ with tolerances to ±0.005% and TCR's to 0±1 ppm/°C. Also, shown are temperature-sensitive resistors and compensators to +6000 ppm/°C. as well as a complete line of four-terminal thru-hole and SMD precision sub-miniature current shunts.

4. LOW VALUE/LOW TCR COMBINATIONS
PRC's extremely low values to 1 milliohm and TCR ±15 ppm/°C. provide better load-stability. This means the quality to resist permanent change is designed into the parts from the start for dependable and repeatable measurements piece-to-piece.

5. HIGH SURGE CURRENT HANDLING CAPABILITIES
Many other resistor types on the market require at least 2 or more parts to equal the power and overload capabilities of 1 PRC resistor. That's why the 3 and 5 watt precision shunt values are so popular.

6. COMMERCIALLY PURE COPPER TERMINALS
Why copper? Because of its excellent current carrying capacity. No material is better suited for precision parts than commercially pure copper. That is, oxygen-free, high conductivity, low resistivity, hot-tinned copper terminals. Hot-tinned rather than electro-tin plated terminals because they offer better wetting characteristics and longer shelf life. Beware of copper clad or other materials that have a strong magnetic attraction and exhibit a high EMF especially when specifying low value precision resistors. Another reason engineers want commercially pure copper is because of its low resistivity.

7. LOW THERMAL EMF VS. COPPER
All PRC resistors (especially low values) have low EMF (<0.3 to 1.5 microvolts per deg. C.) with respect to the copper terminals. Many low value tin oxide and other general-purpose power resistors in the industry have thermocouple errors as large as 100 microvolts per deg. C., which degrade circuit performance. Try to avoid thermal gradients that could cause a large temperature difference across the resistor and specify resistors with low EMF construction.

8. TIME-PROVEN SERVICE
PRC's precision/power resistors are the choice of engineers and designers because of their reasonable costs and time-proven heavy-duty service. Reliability and dependable quality year-after-year are "the real value" of precision wire wound resistors.

If you are looking for stable quality components specifically designed for repetitive & predictable applications then review this easy-to-specify brochure and select exactly what you need. Let our 70+ years of invaluable experience in resistor design and manufacturing work for you. We are very confident that you too can ***"profit from Precision."***

PRC FACTS

When you need "the ultimate in Precision" consider these facts:

1. TOLERANCE, TCR & AMBIENT TEMPERATURE as One Spec

The TCR and temperature are also vital factors when specifying very accurate resistors and must be part of the equation.

Resistance Tolerance is expressed as (±) plus or minus percent of the nominal value (ohms) required. (All PRC resistors are calibrated and tested within specified limits at 25°C unless otherwise noted.)

TCR - We know there is no TCR (Temperature Coefficient of Resistance) without a change in temperature. That is, no proportional change in resistance without a change in the ambient or some self-generated temperature shift resulting from an excitation of power. This variation in resistance with respect to the change in temperature is expressed in parts per million (ppm), Percent (%) or in ohms/ohm … per °C

For Example: The TCR for 0±5ppm, also expressed as ±0.000005Ω or ±0.0005% per degree C. as with all TCRs at PRC, is calculated between +25°C. and +100°C using the industry standard formula on page 9 … unless otherwise noted. Therefore, a 1000Ω 5ppm resistor is multiplied by 0.000005Ω or 0.005Ω change/°C

Temperature - is the measure of heat or cold of an object or substance and directly related to the TCR and tolerance. Since the TCR char. is the variation in resistance above or below room ambient (23°C or 25°C) or a span that includes both, it is essential with close resistance tolerances and low TCR requirements, to specify the temperature span of operation and treat all the surrounding conditions affecting the resistor as "one-spec."

2. WHY'S STABILITY SO IMPORTANT?

Stability is the quality to resist permanent change, and must be designed into the parts from the start. It is very difficult to stabilize or condition a general-purpose resistor and be confident that it will meet a critical application. All stability specs at PRC are designed for precise requirements even if you specify ±1% resistance tolerances.

3. EXTRA POWER … When You Need It!

PRC's precision power resistors are noted for the surge current handling and overload capabilities. However, all catalog ratings are based upon standard ±1% resistance tolerances at +25°C or +125°C depending upon the resistor type. Derating is required for higher temperatures and closer tolerances. Please refer to the derating curves for each type resistor. Usually a larger part or a lower TCR will help, but heat is heat and must be carried off in some manner.

4. LVS SHUNT is PRC's "crown jewel" for SURFACE MOUNT CURRENT SENSING

The LVS on page 6 as well as the PLV 4-lead version on page 7 are ideal in voltage drop applications and for accurate current-sensing requirements … because of their stability and flexibility. These unique parts not only offer lower values with closer tolerances, but also lower TCR's (10ppm) … over a wider temperature span. The low TCR feature provides better thermal stability for more dependable measurements under load conditions. In addition, PRC's shunt values provide low EMF with respect to the tinned copper terminals. Thermal effects, EMF and dissimilar metals become part of the resistance readings of low values. Specify low EMF and try to avoid thermal gradients that could cause a large temperature difference across a critical part. Obviously, the more information we have, the better we are able to match parts to your specifications.

5. PRC INTERESTING FACT

One of the shunt values we tested was a ten milliohm, 10-watt part (PLV10AL 0.01Ω ±1%) that developed over 30 amperes under full load. Because of its aluminum oxide rectangular case and special low TCR element, the resistance change (under load) was less than ±0.1% … and there was virtually no measurable EMF. Now that is a breakthrough!

We certainly were impressed with the results ... and we are confident we can help you in a similar manner.

6. PRC OFFERS THESE FEATURES:

1. Wide variety of shapes & sizes
2. Measurable and predictable voltage/temperature relationship piece-to-piece.
3. Low value/close tolerance combinations.
4. Low TCRs
5. High temperature insulation.
6. Single-joint 4-terminal construction to eliminate lead-out and contact resistance.
7. Assorted diameters of pure copper leads for high current-carrying capacities and lower resistance per circular mil foot.

7. YOU CAN CUSTOM DESIGN YOUR OWN LOW VALUE PRECISION SHUNT

That's right, you can design, test and fine-tune engineering samples so they perform like a precision instrument. Try a few of our shunts today, because many of the popular values are in-stock for immediate delivery. Better yet, if we don't have exactly what you need in stock, special engineering samples will be manufactured to your specs quickly … and at no cost!

ENGINEERING DATA:

RESISTANCE AND TOLERANCES

You can select any ohmic value or decimal part of an ohm with tolerances to ±0.005% 10Ω min. required for ±0.01% tol.

TCR CHARACTERISTIC

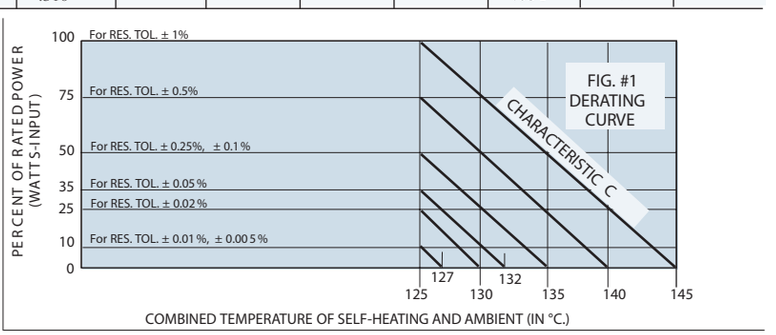
Standard: 0±5ppm/°C (100Ω and above); 0±15ppm/°C. (values below 100Ω) - calculated between +25°C. and +100°C. (Please specify temperature span of operation.)
Special: to 0±1 ppm°C. - matching to 0±0.5 ppm°C.

POWER VS. AMBIENT TEMP.

All Ultra resistors are designed for full load based upon ±1% res. tol. - providing the ambient temp. - plus the temp. rise due to self-heating does not exceed +125°C. Derated to zero power at +145°C. see Fig. 1.

STABILITY

To ±0.001% / yr. at 25°C. (no load).



THERMAL EMF VS. COPPER TERMINALS

< ±3 microvolts per degree C.

INDUCTANCE

Non-inductive balanced reverse pi windings are standard on HR and RX. Special on HVS & HVA.

PROTECTIVE SEAL

Stress free base coat and epoxy case. Solder heat and solvent resistant.

MARKING (Identification)

PRC symbol, type, value and tolerance.

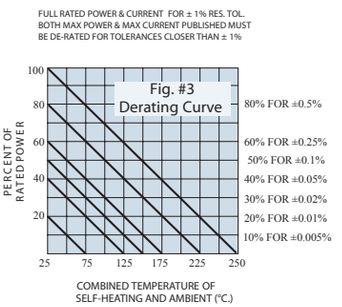
ISSUE NO. 42

LVS/PVS - CURRENT SENSING

How LVS/PVS Shunts Will Benefit You:

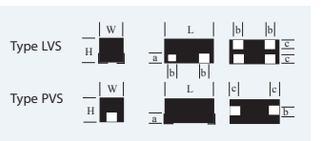
SMD current-sensing ..... to 15 amperes
Ohmic/voltage drop tolerances ..... to ±0.005%
Values ..... from 1 miliohm to 100KΩ
TCR Char. ..... 15ppm (Std.) to 0±10ppm/°C
Temperature Span ..... -65 to +250°C (@ 1%)
For closer tolerances, see Fig. # 3 De-rating Curve



Precautionary Statement applies to all SMDs /SMTs

*Not to be exposed to temps above 150°C for ±0.1% Tol. And 125°C for tolerances closer than ±0.1% without prior heat testing qualification approval procedures.

Re-flow solder methods not recommended closer than ±0.25%



PRC's unique "single joint" design on the 4-tab LVS Series makes tab I.D. academic so you may select the pair closest to the top as your sense leads & the bottom pair for the current leads or vice versa

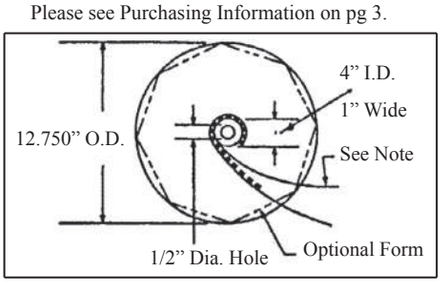
1. RESISTANCE AND TOLERANCES
You can select any ohmic value or decimal part of an ohm from 0.001Ω to 100KΩ with microhm/microvolt accuracies to ±0.005% see Fig. 2 above.
2. TCR CHARACTERISTICS
0±15 ppm/°C.(std.) Please specify temperature span of operation. Add LTC in the part # for TCR 0±10ppm/°C. to +150°C.
3. STABILITY VS. TIME
to ±0.001%/yr. at 25°C. (no load)
4. PRECISION POWER
Standard Min. Res. @ Max. Watts based upon ±1% resistance tolerances at 25°C. (please see end column above). Derating is required for higher temperatures, closer tolerances and lower resistance values please see Fig. # 3 at top of page.

ENGINEERING DATA:

5. PROTECTIVE SEAL
Rectangular solvent-resistant epoxy case offers excellent thermal transfer to base.

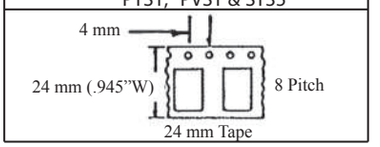
6. TERMINALS
Solderable "hot-tinned" pure copper (ETP/OFHC) tab terminals and low EMF construction reduces thermal effects usually associated with low value resistors.

7. SMT "Carrier Tape" PACKAGING
per IEC 286-3 (EIA 481):
Please see Purchasing Information on pg 3.

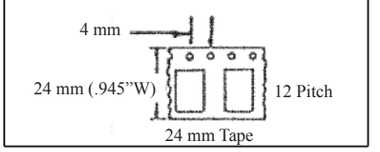


Note: Skin packed to tape with polyfilm

For types: HVS1, PRC100T, PTS1, PVS1 & ST35



For types: HVS2, HVS3, LVS2, LVS3, PTS2, PTS3, PVS2, & PVS3



For types: LVS5, PVS5 & HVS5

*Precision 4-Lead design eliminates contact and lead-out resistance. 2 concentrically located current leads and 2 offset potential leads.

Suffix letters "AL" = Aluminum Case

ENGINEERING DATA:

1. RESISTANCE VS. TOLERANCE
You can select any value from 1 milliohms to 100Ω. Please refer to Fig. #2 for Resistance vs. Tolerance ratios.

2. TCR: 0±15 ppm/ °C (Std.)
Specify - LTC for 0±10ppm to +150°C

3. POWER & CURRENT RATINGS
Full power ratings are based upon ±1% res. tols. at 25°C. Derating is required for closer tolerances, higher temperatures (Fig. #3) and lower values. Refer to Std. Min. Res. @ Max. watts in above column.

4. STABILITY
To ±0.001%/yr. at 25°C (no load).

5. TERMINALS
All PLVs have solderable "hot-tinned" pure copper wire leads. Higher current-carrying capacity leads to #8 AWG are available for full power ratings on values below the Std. Min. Res. listed.

6. PROTECTIVE ENCAPSULATION
PLVs are sealed in high temp/solvent resistant epoxy. Epoxy/aluminum cases are available on 7 watt & 10 watt sizes.

7. MARKING
PRC symbol, type ohmic value and tolerance. Custom marking is available.

FULL RATED POWER & CURRENT FOR ± 1% RES. TOL. BOTH MAX POWER & MAX CURRENT PUBLISHED MUST BE DE-RATED FOR TOLERANCES CLOSER THAN ± 1%

ISSUE NO. 42

MORE PRC FACTS

You can achieve dramatic results with PRC's Compensators:

1. LINEAR COMPENSATION
PRC's type PT/ST (+) TCR Char. 3500ppm/°C. linear tracking temperature sensitive resistors help you develop the desired compensation for true RMS measurements… and can offset errors in dB output circuits.

2. TOLERANCE ON +3500ppm/°C.
>±100ppm/°C. from +25°C. to +100°C.

For example: if you are looking for a systems offset of +3350 to +3450ppm/°C. … try a few engineering samples of our (std.) off-the-shelf compensators. We are confident you can achieve dramatic results. The element wire used on our type PT/STs, as a rule, is very close to +3350ppm/°C. at 25°C. and lower that +3450ppm/°C at 100°C Please refer to the corresponding tracking chart - Fig #4 on pg. 9

3. OFF-THE-SHELF / IMMEDIATE DELIVERY
Thru-hole and SMD designs are available for evaluation and tests. Ask about our PT styles (or the type AT35) for your wire lead terminals required. Also, if you have plans for SMT … our type ST35 is a drop-in replacement for the thru-hole part with interchangeable specs.

4. CUSTOM COMPENSATORS
Remember - we can customize any of our compensators to your specs in any ohmic value with pure metals, available alloys or composite windings. All of which are extremely linear, reasonably priced and delivered quickly.

5. TRACKING CHART
Constant temperature oil bath computer tracking charts are available to match your temperature span and behavior specs exactly.

(Continued on Pg. 9)

Attributes of the ***extremely versatile*** PRC100 Series include:

1. THE PRC100 (Std. Reference):
A PLATINUM ALTERNATIVE
Like a platinum RTD, the PRC100 Std. is 100Ω at 0°C. ±0.12% with a TCR of +3850 ppm/°C. that meets the theoretical curve of platinum as defined by the IEC Standard, pub. 751 (per DIN Std. 43760, Class B) alpha = 0.00385 ohm/ohm/°C. Please refer to the chart and equations on Pg. 10.

2. CRITICAL FACT TO REMEMBER:
Always use a consistent Base Temperature of Zero (0)°C in the platinum and PRC100 equations.

For example: The nominal resistance of a platinum RTD and the PRC100 Std. is 100Ω at Base 0°C. Then, if we use +100°C as the other reference point, the TCR is calculated to be very close to +3850 ppm/°C The base temperature is important in this situation because the TCRs of all other resistance alloys are usually calculated between Base +25°C and +100°C. Any other reference points and resistance values in the TCR equations will give you a result other than the TCR expected.

Platinum is generally offered in two grades: the Standard American Reference Grade of 0.003923 ohm/ohm/°C and the DIN of 0.003850 ohm/ohm/°C. We have selected the DIN Standard for our PRC100 (Std. Reference) to demonstrate our capability and the flexibility of this design for custom high quality special-purpose sensors.

3. THE PRC100 STD. REFERENCE SERIES IS IN STOCK & READILY AVAILABLE
The Standard 100Ω reference is offered in an assortment of physical sizes for thru-hole, SMD, and probe applications. If you need a few pieces or several thousand of any of the PRC100 configurations, we can usually ship them directly from our stock.

4. DO YOU NEED HIGH QUALITY "CUSTOM" SENSORS?
If you do, the PRC100 Custom Series is actually more versatile than a platinum RTD, because you can select any ohmic value and tolerance that you need, and adjust the TCR characteristic ... if you want a slightly higher or lower ohms change per degree C.

Let us know your exact particulars and we will custom manufacture the part to your specs and send you a sample together with a computer-tracking chart at no charge.

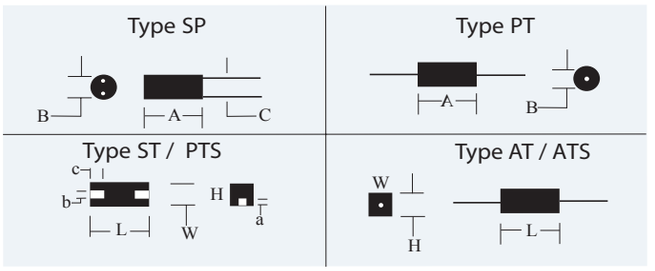
COMPENSATORS



How Can You Benefit From Our Custom Compensators?

1000 Ω 3500 PPM Compensators ..... are in stock.
Thru-hole or SMD ..... it's your choice!
Low RMS Noise ..... for A/D conversions.
Linear Tracking ..... from -65 to +150°C.
Custom Values & TCRs ..... for high or lower ΩΔ/°C.

AXIAL & PROBE SPECIAL-PURPOSE COMPENSATOR/SENSORS

ENGINEERING DATA:

1. ALL STANDARD 1000 Ω ± 1% TOLERANCE +3500 PPM COMPENSATORS ARE IN STOCK

Special: Any value from 1Ω to 50KΩ. Tolerances to ±0.05%.

2. TCR CHARACTERISTICS AVAILABLE

+80 ppm/°C +3930 ppm/°C
+140 ppm/°C +4300 ppm/°C
+400 ppm/°C +4500 ppm/°C
+1400 ppm/°C +5000 ppm/°C
+3500 ppm/°C +6000 ppm/°C

*** TC TOLERANCE WINDOW ± 5%**
Calculated between +25°C. & +100°C.

$$TCR = \frac{\Delta R \times 10^6}{R_o \times \Delta t}$$

R_o = Original resistance at reference temp.
ΔR = Change in resistance at test temp. from resistance at reference temp.
Δt = Difference between test and reference temp. in degrees.

3. COMPENSATORS VS. POWER

PRC's positive TCR resistors are used to offset negative ambient temperature changes or counter self-generating shifts in resistance with an excitation of power to 0.25 watt at +125°C (Derated to zero watts at +150°C)

4. STABILITY ENSURES LONGER SHELF-LIFE

Standard: ±0.05% per year at 25°C. w/ no load.
Special: < ±0.01% per year at 25°C. w/ no load.

5. PROTECTIVE SEAL

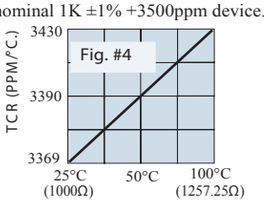
Standard: Conformal silicone or epoxy case.
Special: Thermal conductive insulating coatings.
Un-coated components are also available upon request.

6. MARKING

PRC symbol, type, resistance value, tolerance and TCR characteristics, physical size permitting.

7. RES/TEMP CURVE & EQUATION

For nominal 1K ±1% +3500ppm device.



e.g. 1000Ω at 25°C. is 1257.25Ω at +100°C.

$$TCR = \frac{R@100°C - R@25°C}{R@25°C \times 75} \times 10^6$$

$$TCR = \frac{1257.25 - 1000}{1000 \times 75} \times 10^6$$

TCR = +3430ppm/ °C or 3.4ΩΔ/°C

RESISTANCE TEMPERATURE CHARACTERISTIC (Rt)

Rt is defined by IEC standard, pub. 751:
alpha = 0.00385 ohm/ohm/°C.

... For range -40°C to 0°C:
Rt = $R_0[1+At+Bt^2 +C(t-100°C)t^3]$
....For range 0°C to +150°C:
Rt = $R_0(1+At+Bt^2)$
where the constants in these equations are:
A = 3.79782×10^{-3}
B = 6.502×10^{-7}
C = 4.3735×10^{-12}

$Rt = R_0[1+At+Bt^2]$
$Rt = 100 [1+ (3.79782x10^{-3} \times 100) + (6.502x10^{7} \times 100^2)]$
$Rt = 100 [1 + .379782 + .006502]$

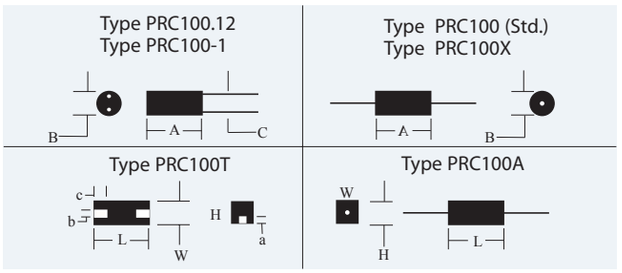
PRC100 SENSORS



What The PRC100 Means To You:

The PRC100 Custom Series is more than a platinum alternative because of its versatility.

The PRC100 (Std. Reference) ..... 100Ω at 0°C. ±0.12% with an average sensitivity of 0.00385 ohm/ohm/°C is in-stock for immediate delivery.

PAD LAYOUT

ENGINEERING DATA:

1. RESISTANCE AND TOLERANCE

PRC100 (Std. Reference): 100Ω at 0°C
±0.12% (or ±0.3°C) and 138.50Ω at +100°C
±0.22% (or ±0.8°C) per DIN 43760, Class B.

PRC100 (Custom Series): You can select any value from 50Ω to 5 Kilohms in tolerances from 1/4 DIN (±0.03%) to 2 x DIN (±0.24%).

2. RESISTANCE TEMPERATURE CHARACTERISTIC (Rt)

Rt is defined by IEC Standard, pub. 751:
alpha = 0.00385 ohm/ohm/°C*

... for range -40°C. to 0°C:

$$Rt = R_O [1+At+Bt^2 + C(t-100°C)t^3]$$

... for range 0°C. to +150°C:

$$Rt = R_O (1+At+Bt^2)$$

Where the constants are:

$A = 3.79782 \times 10^{-3}$
$B = 6.502 \times 10^{-7}$
$C = 4.3735 \times 10^{-12}$

Fixed points are in degrees Celsius, R_O = 0°C
The other (Ref.) temperature is + 100°C, but any temperature can be used in the equation with respect to Base 0°C. The PRC100 Std. Ref. follows a well-defined theoretical curve and linear slope from Base 0°C proving that most reference points are calculable within very close tolerances (Ratio = Rt/R_O).

3. STABILITY OF CALIBRATION

All PRC100 sensors are closely matched and repeatable part-to-part. They are able to consistently reproduce output readings consecutively at the same temperature reference points ... under the same conditions and in the same direction.

4. STABILITY (R_O) VS. TIME

The change in the original resistance (R_O) at 0° C after 10 cycles to +150°C is less than ±0.1°C or ±0.038% max. Shelf life stability is ± 0.002%/yr. at 25°C (no load).

5. POWER RATINGS VS. AMBIENT TEMPERATURE RANGE

The PRC100 is ideal as a compensator to offset drift or negative self-generating changes in resistance as a result of an excitation of power to 0.25 watt at +125°C to zero power at +150°C.

6. THERMAL TIME CONSTANT

The time required for the PRC100 sensor to indicate 63.2% of a new impressed temperature from a step change of 0°C to +100°C can be customized to < 1 second

* Theoretical curve and slope are based upon values of the International Practical Temperature Scale (IPTS-68 & 90).

7. PRC100 (Std. Ref.) CONSTRUCTION

Wire: Ni, Co, Mn & Fe.
Substrate: Epoxy or ceramic form.
Terminals: Solderable hot-tinned copper.
Protective Seal: Moisture and solvent resistant epoxy.

8. MARKING (Std. Reference)

PRC100X
PRC100A
PRC100T
PRC100

TC.385%

9. CUSTOM APPLICATIONS

PRC100 (Custom) Series Sensors are available in any ohmic value with TCRs from +3000ppm to +4000ppm/°C in 50ppm steps with the same linear tracking characteristics as the Std. Ref.

Custom Marking: e.g:
1K ohms = PRC1000
10K ohms = PRC10000, etc.

tCommercially pure copper (Electrolytic Tough Pitch/Oxygen-Free High Conductivity).

ENGINEERING DATA:

1. RESISTANCE AND TOLERANCE
Select any ohmic value or decimal part of an ohm desired with tolerances to ±0.05%.

2. TEMPERATURE COEFFICIENT OF RESISTANCE ALSO KNOWN AS T.C.R.
Standard: 0±10ppm/°C (100Ω and above).
0±15ppm/°C (values below 100Ω).
For specific TCRs to ±1ppm/°C see page 5.
Refer to page 9 for TCRs to +6000ppm/°C.

3. STABILITY VS. TIME CHARACTERISTICS
To ±0.005%/year at +25°C. with no load.

4. POWER RATINGS VS. AMBIENT TEMP. AND RESISTANCE TOLERANCE
Full power ratings are based upon standard ±1% resistance tolerances. Derating is required for higher temperatures and closer resistance tolerances.
Max Temperature for SX Coating: +145°C.

5. INDUCTANCE
The standard type SX resistors are inductively wound. Non-inductive windings are available - add suffix letter "N" in the part number.

6. TERMINALS
Standard: Solderable hot-tinned pure copper leads.

7. PROTECTIVE COATING
Solvent resistant silicone/epoxy seal.

8. MARKING
PRC symbol, type, value and tolerance.

* 0.02Ω to 0.1Ω and maximum resistance values available in non-standard physical sizes 0 to +.0625".
All low value 2-terminal designs are calibrated and tested at mid-point on lead unless otherwise specified.

ENGINEERING DATA:

1. RESISTANCE RANGE
PRC's sub-miniature type SM "precision power" resistors offer the widest range of ohmic values anywhere.
You can select any value or decimal part of an ohm from 0.02Ω to 4 Megohms.

2. CUSTOM TOLERANCES
±1%(Std.), ±0.5%, ±0.25%, ±0.1%

3. TCR CHARACTERISTIC
Standard: 0±10ppm/°C for 100Ω and above and 0±15ppm/°C below 100Ω.
For specific TCRs to ±1ppm/°C see page 5.
Refer to page 9 for TCRs to +6000ppm/°C.
***Must Specify Temp. Span of Operation.**

4. VOLTAGE RATING
DC Voltage or Peak Voltage:
The type SM's high operating voltage winding patterns eliminate dangerous crossovers and potential problems usually associated with standard style bobbins and mandrel designs. To calculate the safe operating voltage for any resistance value below the maximum listed, apply the formula: $E=\sqrt{PR}$.

5. PRECISION POWER RATINGS
All standard ±1% tolerance type SM resistors are designed for continuous full load operation at +25°C. Derated to zero wattage at +275°C (see Fig. #5 above).

6. INDUCTANCE
Standard: Inductively wound
Special: Non-inductive winding is available, simply add suffix letter "N" to the end of part number.

7. TERMINALS
Standard: Solderable hot-tinned pure copper leads.

8. PROTECTIVE SEAL
SM resistors are coated in a tough solvent resistant high-temperature silicone formulation … with indelible marking.

* Heavier current carrying capacity leads are available for low resistance - full power applications. Refer to Type PLV for custom millivolt drop requirements.

ENGINEERING DATA:

1. RESISTANCE AND TOLERANCE

Standard: Any ohmic value or decimal part of an ohm desired from 0.015Ω to 100Ω with tolerances to ±0.005%.

Special: From 0.001Ω through 0.015Ω with tolerances to ±0.1%. Please see Fig. 6 Resistance Vs. Tolerance ratios above.

2. TCR CHARACTERISTICS

Standard: 0±15 ppm/°C. between 25 & 100°C.

3. STABILITY VS. TIME CHARACTERISTICS

To ±0.001% per year at +25°C. with no load.

4. SOLVENT RESISTANCE COATING

… with indelible marking.

5. POWER & CURRENT RATING

The Standard Minimum Resistance at full power (see above column) is based upon ±1% resistance tolerance at +25°C. Derating is required for lower res. values, closer tolerances and higher temperatures. Please refer to Fig. # 7 at top of the page.

6. TWO-TERMINAL VS. FOUR-TERMINAL (Kelvin)

Two-terminal resistors are generally used for high ohmic values, where the effects of lead-out resistance and contact resistance are minimal. Allow approximately ±0.001 ohm per inch for the lead-out resistance on 2-Wire designs. However, on low values where lead resistance can be part of a very accurate measurement, the adder may be eliminated by using a 4-terminal device, because 4-Wire circuits will only indicate the voltage drop across the resistor.

7. FOUR TERMINALS

PRC's type SM-4 has four solderable hot-tinned copper wire leads. Lead identification is academic because of its single-joint construction. However for uniformity, while observing the PRC marking on the body of the resistor, select the 2 leads closest to the top for your sense leads and the other two as the current leads.

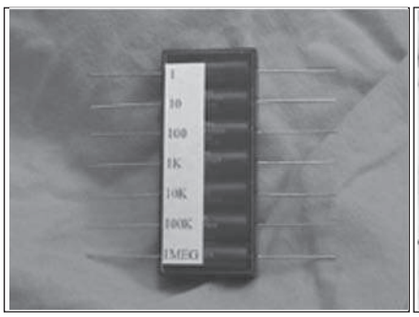
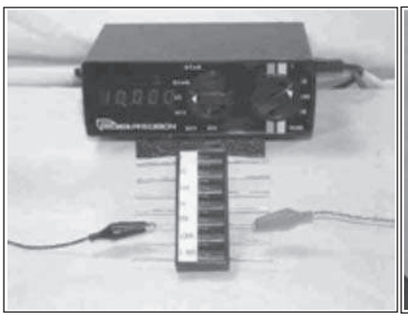
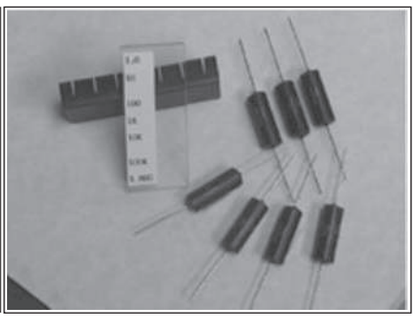
DIGITAL MULTIMETER CALIBRATOR

The MC-7 Digital Multimeter Calibrator is a packaged group of seven (7) High-Precision resistors part # HR3716N, with ohmic values ranging from 1.0Ω to 1Megohm - used in the verification and adjustment of the resistance function of 3½ and 4½ digital multimeters. To your advantage, the MC-7 is always in-stock … ready for delivery.







FOR YOUR CONVENIENCE

The seven (7) resistors are contained in a plastic case with the leads extending through the sides - ready to go to work.

VALUES & TOLERANCES

1Ω 0.02%
10Ω 0.02%
100Ω 0.01%
1KΩ 0.01%
10KΩ 0.01%
100KΩ 0.01%
1MEGΩ 0.01%

HR3716N PHYSICAL SPECS:

Length ..... 25.40mm (1.00")
Diameter ..... 9.53mm (.375")
Leads ..... 0.032" dai X 1.0" long

D.C. mV METER SHUNT

What Type MS means to you:

Resistance Value ..... from 0.001Ω to 100Ω
Tolerances ..... to ±0.005%
TCR Characteristics .....to±10ppm/°C
Temperature Span ..... -65 to +275°C
DC Current ..... to 50 Amps Max.
2 & 4 Terminals for power or current-sensing

Type MS-40

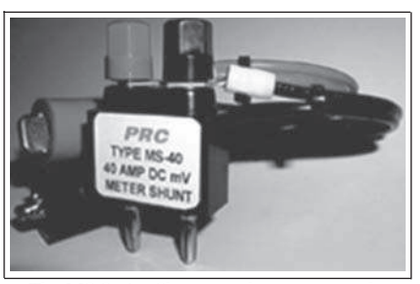
(0.001Ω ±0.5% shunt) lets you quickly test current up to 40 Amps with a standard multimeter.

PHYSICAL SPECS:

Length ..... 1.50"
Height ..... 2.00"
Width ..... 0.65"
Terminals ..... 0.75"
(Center-to-center)

Input/Output Conversion Chart

1 Amp = 1mV
2 Amps = 2mVs
5 Amps = 5mVs
7 Amps = 7mVs
10 Amps = 10mVs
20 Amps = 20mVs
30 Amps = 30mVs
40 Amps = 40mVs



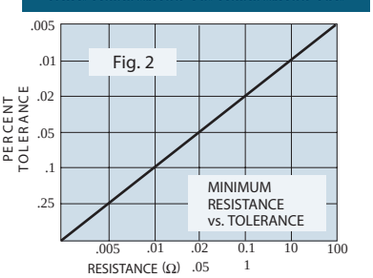
The MS Series Shunts can be custom-made for 50mV & 100mV applications. The values below are typical values for the 50mV shunts using the Volt Drop Method :

Ω (R)	Current (I)	Watts (P)
0.001	50A	2.50W
0.002	25A	1.25W
0.003	16.7A	0.83W
0.004	12.5A	0.62W
0.005	10A	0.5W
0.006	8.3A	0.42W
0.007	7.14A	0.36W
0.008	6.25A	0.31W
0.009	5.5A	0.28W
0.010	5A	0.25W
0.020	2.5A	0.125W
0.025	2A	0.1W
0.030	1.67A	0.08W
0.040	1.25A	0.06W
0.050	1A	0.05W
0.100	0.5A	0.025W
0.200	0.25A	0.0125W
0.250	0.2A	0.01W
0.500	0.1A	0.005W
1.00	0.05A	0.0025W

OHM'S LAW FORMULAS

I = (E/R), (P/E), ($\sqrt{P/R}$) P = (E^2/R), (EI), (I^2R)
R = (E/I), (E^2/P), (P^2/I) E = (IR), (P/I), ($\sqrt{PR}$)

Min. Resistance Vs. Resistance Tol.



ENGINEERING DATA:

1. POWER RATINGS: 10 WATTS MAXIMUM
   All resistance values at full power are based upon ±1% resistance tolerance at 25°C. Derating is required or higher temperatures and/or closer tolerances.
2. RESISTANCE AND TOLERANCES:
   0.001Ω to 100Ω in any specified value or decimal part of an ohm - to ±0.005% - see Fig. 2 (Min. Resistance vs. Resistance Tolerance).
3. TCR CHARACTERISTICS:
   to 0±10 ppm/°C
4. TERMINALS:
   Heavy-duty commercially pure copper test leads match current rating of shunt selected. Also Four(4) low EMF copper terminals are available for very accurate current-sensing applications.
5. MARKING:
   PRC symbol, type, resistance, value, tolerance and terminal. Custom marking, if specified.
   e.g. MS-40A = 0.001Ω (to 40 amps).
